Editor-in-Chief

*Journal of Electrocardiology*

Dear Editor,

Please consider our manuscript, “Reader Disagreement Identifies Residual Diagnostic Risk in Automated ECG Interpretation,” for publication as a Short Communication in the Journal of Electrocardiology.

This secondary analysis of the CODE datasets examines whether reader disagreement identifies diagnostic difficulty that persists after uncertainty-based referral of automated ECG interpretations. Although referral of lower-confidence ECGs reduced the overall diagnostic error burden, ECGs with initial reader disagreement retained substantially greater error risk. The findings highlight information about diagnostic reliability that is lost when multiple expert interpretations are collapsed into a single adjudicated reference label.

The manuscript is original, has not been published previously, and is not under consideration elsewhere. I have reviewed and approved the manuscript and take responsibility for its content.

Sincerely,

Khanh Duy Tran School of Electrical Engineering International University – Vietnam National University, Ho Chi Minh City Vietnam
